

Cooper - 23.5 inches and 90 lbs - is the stud dog we use for all our initial crosses, and as such he is the cornerstone of our Bandogge program. His ancestry includes Bullmastiff, as well as a high percentage of American Staffordshire Terrier and A.P.B.T. “Coop” has incredible drive and athleticism, and he really brings a lot to the table from a genetic perspective. He is available at stud to approved females with a current brucellosis test.

Not At Risk

Good news! Cooper did not test positive for any of the genetic diseases that Embark screens for. Read on to learn more about the conditions we test for, but rest assured that Cooper does not have the mutations known to cause them.

It is still important to let your veterinarian know these results because they could help guide Cooper's diagnosis and treatment if he gets sick in the future. Many other diseases caused by environmental factors or undiscovered genetic variants can cause symptoms similar to diseases we test for. By ruling out these mutations, your veterinarian will be able to find the true cause more quickly. Your veterinarian will also know they can safely prescribe medications some dogs are sensitive to.
